

Stay safe, be sure to check pc system information

Today's internet is crowded with software and users that are brand new to computers and the internet and are totally unaware of how to check pc system information on their computers. This combination can be dangerous for the average web surfer. Viruses and spyware can infect a naive user, and then use that user's computer to branch out to other individuals' computer systems to spread the viruses. This is why it is of utmost importance for every individual to stay on top of their computer, and check pc system information. Do not do it only once either, check [pc system](#) information routinely.

To form the first basic set of protections three steps are involved. First, enable a firewall in your operating systems. Most operating systems come with a firewall built in, but many free firewall software packages exist online if your operating system does not come with one. Check pc system information to verify if this firewall is turned on and in operational state. A firewall keeps uninvited individuals from connecting to your computer from the internet, hence the name firewall. The second step is a crucial step, with two parts. First find some high quality antivirus software, whether it be buying it in the store or finding a free version of the software online. Research before you make your choice however as the software package you choose will be one of the major defenses against viruses and other negative things that can befall your system. Once your software package is installed and running, be sure to check pc system information to verify that it is indeed operating. The second part of this step is to update the virus scan software and check pc system by running a full scan of the computer. Keeping the software updated is integral to protecting the system, as new viruses are released every day so your software package must keep on top of them. The third and final step is to utilize good judgment. Do not download software you are not sure is safe, and do not visit websites that do not look secure. Lastly, be sure to check pc system information to verify all the correct software is running. With these three steps and some common sense you can keep your computer safe and running at its maximum potential.
